

THE NEXT KILLER APPLICATION

GOOGLE™ APPLICATIONS WITH UNIFIED COMMUNICATIONS

Google™ Applications integrated with your Enterprise UC platform forms one SUPER application. All the power of communications, mobility, messaging and collaboration with a quarter of the hardware, management and cost of a traditional IBM or Microsoft® solution. Now small businesses between 5-50 users can have all the benefits of an onsite email server without investing in any hardware or resources to deploy. Without changing their phone system or mobile phones, everything can work seamlessly together leveraging unified communications to link infrastructure to software as a service model. No more upgrades or maintenance, everything is live from any computer and always as the latest version.

Unlike other free webmail and web based application services, GMAIL is built on the idea that users should never have to file or delete a message, or struggle to find an email they've sent or received.

Key Features of Gmail

Search, storage and speed are just some of the advantages of Gmail. Google™ applications search technology allows a quick search of every mail sent or received. Using keywords or advanced search features combined with UC provide a full index of searching capabilities for voice mail, fax messages, and recorded conversations directly from their inbox.

The UC services tie the Gmail hosted services to the Enterprise telephony infrastructure. Users can link their office desk phone and mobile phone into Google™ Applications. When you receive an urgent email or voice mail, the UC system will light your office telephone message light. Users can use the telephone to login to their Gmail with speech and access, manage and respond to all their email, voice mail and fax messages. Office workers leveraging thin clients can simply use a browser with any OS and login to Gmail to gain access to their voice messages, faxes and recorded conversations.

The UC server provides organizations with a compelling reason to move from enterprise Groupware solutions to a fast, lightweight, hosted service that delivers all the features and value of a full UC solution from both Microsoft® and IBM®.

LINKING
all your daily communications

This is like deploying a full Microsoft Exchange Server, Active Directory and Office Communication Server at a fraction of the cost, and with virtually no overhead. The UC integrates SAAS (Software as a Service) technology to enterprise infrastructure. Now customers can deploy UC with minimal expense in terms of time and money. The web-based service of Google™ Applications also provides a complete cross platform solution. Combined with the cross platform of our Mobile UC client, customers can integrate UC with any environment.
